                                                               ö
                                                                                                                                                                                                                                                                                                   Sequence 3, Application US/08292870

Patent No. 5814467

GENERAL INFORMATION:

APPLICANT: Curitiss, Linda K

APPLICANT: Banka, Carole L

APPLICANT: Smith, Richard S

TITLE OF INVENTION: APO AI POLYPEPTIDES, DIAGNOSTIC METHODS

TITLE OF INVENTION: METHODS

TITLE OF INVENTION: METHODS

TITLE OF INVENTION: METHODS

TITLE OF SEQUENCES: 4

NUMBER OF SEQUENCES: 4

GENERAL INFORMATION:
APPLICANT: Smith, Richard K.
APPLICANT: Koduri, Raju
APPLICANT: Young, Stephen G.
APPLICANT: Young, Stephen G.
TITLE OF INVENTION: Lipoprotein Assays Using Antibodies to a
TITLE OF INVENTION: Lipoprotein Assays Using Antibodies to a
TITLE OF INVENTION: Dan Native Epitope and Recombinant Antigens
NUMBER OF SEQUENCES: 20
CORRESPONDENCE ADDRESS:
ADDRESSEE: Dressler, Goldsmith, Shore, Sutker &
ADDRESSEE: Milnamow, Ltd.
STREET: 180 North Stetson, Suite 4700
CITY: Chicago
STATE: Illinois
CONTRY: USA
ZIP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

Biochemistry 15:1928-1933(1976).
-!- FUNCTION: Participates in the reverse transport of cholesterol from tissues to the liver for excretion by promoting cholesterol efflux from tissues and by acting as a cofactor for the lecithin cholesterol acyltransferase (LCAT).
-!- SUBCELIGIAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Major protein of plasma HDL, also found in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy. WPI; 2001-611725/70.

Claim 20; Page 297; 765pp; English.

The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells for use in treatment of a pathology related to aberrant expression to proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell

secreted proteins of the invention

```
The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon subliferation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human
                                                                                                                                                                                      ä
proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33104 represent the amino acid sequences of novel human secreted proteins of the invention

```
The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon a cimination, as anti-inflammatory agents; and in treatment of leukaemias. ANU29510-ANU33304 represent the amino acid sequences of novel human

The peptides represented in AAR20164-65 are capable of immunologically mimicking an Apo AI epitope. They are useful in diagnosis and detection of Apo AI in fluids and for preparing anti-Apo AI antibodies. It is useful in therapeutic methods for increasing LCAT- mediated cholesterol esterification in humans. The Apo AI polypeptide is selected from the peptides indicated in the features and includes amino acids 13-28 defining a conserved native epitope on Apo AI capable of immunoreacting with monoclonal antibody MAB AI-11.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to novel GENSET polynucleotides (ABZ36404-ABZ3691) encoding polypeptides (ABP75963-ABP76368). The polynucleotides and polypeptides are useful in screening and diagnostic assays for abnormal GENSET expression and/or biological activity. They are also useful for screening of compounds for treating or preventing GENSET-related disorders, such as heavy metal toxicity, cancer, inflammatory diseases, immune disorders, and the neuromuscular, central nervous system (CNS), cardiovascular or gastrointestinal effects of the toxicity

(CURA-) CURAGEN CORP.

WPI; 2002-106200/14. N-PSDB; ABN75770 Novel human polypeptides and polymucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and disorders related to organ transplantation.

Claim 10; Page 625; 2508pp; English.

call differentiation, immune modulation, beamatopoiesis regulation, tissue growth, anglogenesis, activin or inhibin activity, chemotactic/ chemothinetic activity, heamostatic activity, tumour inhibition activity, receptor/ligand, antiinflammatory activity, tumour inhibition activity, and antiinflammatory also be involved in the determination of bodily characteristics, fertility and behaviour. ORFX proteins, uncleic acids and antibodies may be used in the treatment of cancers, other proliferative disorders such as psoriasis and benign tumours, cardiovascular diseases, immune system disorders disease, activity and protein and cholesterol ester cardiovascular diseases, immune system disorders diseases, and infections diseases caused by viral, bacterial, thungal and other pathogens. ORFX nucleic acids may also be used as a source of primers and probes, in the detection of ORFX genomic sequences or transcripte, in the identification and cloning of homologous cortications any activity of ORFX nucleic acids may additionally be used to produce transgenic animals which may be useful for studding the function and/or activity of ORFX protein, and in drug screening. The ORFX protein may also be used as immunogens to generate specific antibodies, which are useful in the diagnosis, treatment and monitoring of ORFX-associated diseases designated ORF (open reading frame) 1-4534, and sequences ABN75054-ABN7587 represent CDNAs encoding them. The invention also encompasses polypeptides at least 80% identical to the ORF1-ORF4534 (collectively referred to as ORFX) proteins, polynucleotides at least 85% identical to the ORFX nucleic acid sequences, vectors and host cells comprising ORFX polynucleotides, the recombinant production of ORFX proteins, antibodies specific for ORFX proteins, methods of detecting ORFX polynucleotides and activity, and methods of screening for modulators of ORFX expression or activity, and methods of screening individuals for a predisposition to an ORFX associated disorder. The ORFX proteins of the invention have a wide range of biological activities, such as cytokine, cell proliferation, Sequences ABP31028-ABP35561 represent 4534 novel human proteins

They are useful in diagnosis and detection of Apo AI in fluids and for preparing anti-Apo AI antibodies. It is useful in therapeutic methods for increasing LCAT- mediated cholesterol esterification in humans. The Apo AI polypeptide is selected from the paptides indicated in the features and includes amino acids 6-21 defining a conserved native epitope on Apo AI capable of immunoreacting with monoclonal antibody MAB AI-4. The invention relates to a novel isolated G-type polypeptide that ameliorates a symptom of atherosclerosis or other pathology associated with an inflammatory response comprising an amphipathic helical peptide having charged residues on the polar face of the peptide and possessing a wide non-polar face. The polypeptide of the invention demonstrates antiarteriosclerotic, antiinflammaticy, osteopathic, neuroprotective, dermacological, antiinflammatory, osteopathic, neuroprotective, nootropic, anti-HIV, virucide and antibacterial activities. The nootropic, anti-HIV, virucide and antibacterial activities. The ameliorating one or more symptoms of atherosclerosis and/or pathologies characterised by an inflammatory response such as rheumatoid arthritis, systemic lupus erryhematosus, polyarteritis nodesa, osteoporosis, composition and methomatosus, polyarteritis nodesa, osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New G-type polypeptides for preventing or ameliorating symptoms of atherosclerosis or pathologies associated with an inflammatory responses e.g. rheumatoid arthritis, osteoporosis, Alzheimer's disease, AIDS or infections.
                                                                                                                                                                                                                                                                             antiarteriosciencia, antiheumatic; antiarthritic; immunosuppressive; dermatological; antihifleumatic; antiarthritic; immunosuppressive; dermatological; antihiflammatory; osteopathic; neuroprotective; notoropic; anti-HIV; virucide; antibacterial; rheumatoid arthritis; systemic lupus erythematosus; polyarteritis nodosa; osteoporosis; Alzheimer's disease; AIDS; infection; apoAI.
                                                                                                                                                                                                                          ApoAI G* amphipathic helical domain-derived peptide - SEQ ID
                                                                                                                                                                                                                                                                 G-type; atherosclerosis; inflammatory; G* amphipathic helix;

Browsable database system, for e.g. analyzing protein sequences, and predicting a biological role, comprises a datastore, an ontology of categories of biological functions, an input receptive, a recognizer, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a browsable database system for use with biological information, comprises a datastore, an ontology of categories of biological functions, an input receptive, a recogniser and an output. The invention also provides a method of operation for use with a browsable biological database system. The browsable database system and methods are useful in analysing protein sequences, classifying gene products, predicting biological role for pathway building, enhancing interpretation of expression information, providing protein function and in facilitating comparative genomic analysis. The present sequence is monkey apolipoprotein A (APO-A) IV precursor protein. This sequence is used to illustrate the method of the invention.

                                                                                                                                                                                                                                                                                                                                                              Browsable database system, for e.g. analyzing protein sequences, and predicting a biological role, comprises a datastore, an ontology of categories of biological functions, an input receptive, a recognizer, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                        biological information, comprises a datastore, an ontology of categories of biological functions, an input receptive, a recogniser and an output. The invention also provides a method of operation for use with a browsable biological database system. The browsable database system and methods are useful in analyshing protein sequences, classifying gene products, predicting biological role for pathway building, enhancing interpretation of expression information, providing protein function and in facilitating comparative genomic analysis. The present sequence is human apolipoprotein A (APO-A) IV precursor protein. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 SELTQQLNALFQDKLGEVNTYAGDLQKKLVPFATELHERLAKDSEKLKEEIGKELEELRA 60

Browsable database system, for e.g. analyzing protein sequences, and predicting a biological role, comprises a datastore, an ontology of categories of biological functions, an input receptive, a recognizer, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       biological information, comprises a datastore, an ontology of categories of biological functions, an input receptive, a recogniser and an output. The invention also provides a method of operation for use with a browsable biological database system. The browsable database system and methods are useful in analysing protein sequences, classifying gene products, predicting biological role for pathway building, enhancing interpretation of expression information, providing protein function and in facilitating comparative genomic analysis. The present sequence is baboon apolipoprotein A (APO-A) IV precursor protein. This sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Browsable database system; ontology; protein analysis;

Apo AI contains the sequence below (Claim 1 claims AAs 1-15). There is inverse correlation between plasma levels of Apo AI and coronary artery disease risk. The monoclonal antibody recognises this epitope on native Apo AI. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treating conditions associated with lipid oxidation or preventing oxidation in lipid-containing food, lipid containing pharmaceuticals or cosmetic or dermatological compositions.
                                                                                                                                                                                      Apo lipoprotein peptide and monoclonal antibody against it - used to assay peptide in vascular fluid to identify risk of coronary artery disease.
                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AI90-111 and smaller peptides contained within this sequence. AI95-105, AI190-105 and AI190-111 are specifically claimed. Such Apo AI peptides are capable of immunologically mimicking a native conserved Apo AI epitope. They may be helpful in the diagnosis of risk of coronary heart disease. (Updated on 31-OCT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PR field.) This sequence represents a peptide (#2) derived from apolipoprotein (apo)
A-IV with lipid oxidation inhibitory activity. Lipid oxidation plays a
role in the development of atherosclerosis, a main cause of coronary
chart disease. Atherosclerosis is thought to begin with local injury to
the arterial endothelium, followed by proliferation of arterial smooth
cuscle cells, along with deposition of lipid and accumulation of foam
cells in the lesion. As the atherosclerotic plaque develops, it
progressively occludes more and more blood vessel and can eventually lead
cells in the lesion. Both the plasma concentration and qualitative
characteristics of low density lipoproteins (LDL) are risk factors in
atherogenesis. Oxidation causes important changes in the primary
controlled the main LDL apolipoprotein BLOD are risk factors in
atherogenesis. Oxidation ouses important changes in the primary
controlled the main LDL apolipoprotein by macrophages, causes the
intracellular accumulation of esters of cholesterol and the formation of
foam cells, with subsequent development of the atherosclerotic plaque.
The apo A-IV derived peptides can be used for inhibiting lipid oxidation.
The peptides can be used for treating conditions associated with lipid
oxidation. For example, they can be used for treating or inhibiting the
confaction in lipid-containing foods, lipid-containing pharmaceuticals or
cosmetic or dermatological compositions. As these peptides comprise or
imminicant it would be used for treating the humans of imminicals or
imminicant of the native apo A-IV protein the humans adminibuted to humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immunogenicity problems with their administration to humans

methods are useful in analysing protein sequences, classifying gene products, predicting biological role for pathway building, enhancing interpretation of expression information, providing protein function and in facilitating comparative genomic analysis. The present sequence is pig apolipoprotein A (APO-A) IV precursor protein. This sequence is used to illustrate the method of the invention. Browsable database system, for e.g. analyzing protein sequences, and predicting a biological role, comprises a datastore, an ontology of categories of biological functions, an input receptive, a recognizer, and biological information, comprises a datastore, an ontology of categories of biological functions, an input receptive, a recogniser and an output. The invention also provides a method of operation for use with a browsable biological database system. The browsable database system and The invention relates to a browsable database system for use with Disclosure; SEQ ID NO 46; 113pp; English

Sequence 2, Application US/08292870

Patent No. 5814467

GENERAL INFORMATION:

APPLICANT: Curtiss, Linda K
APPLICANT: Banka, Carole L
APPLICANT: Banka, Carole L
APPLICANT: Smith, Richard S
ITILE OF INVENTION: APO AI POLYPEPTIDES, DIAGNOSTIC METHODS
ITILE OF INVENTION: METHODS

ITILE OF INVENTION: METHODS

NUMBER OF SEQUENCES: 4

CORRESPONDENCE ADDRESS:
ADDRESSEE: The Scripps Research Institute, Office of
ADDRESSEE: Patent Counsel

STREET: 10666 No. 5814467th Torrey Pines Road., TPC 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CURRENT APPLICATION DATA:

Sequence 3, Application US/08292870
; Sequence 3, Application US/08292870
; Patent No. 5814467
; GENERAL INFORMATION:
; APPLICANT: Banka, Carole L
; APPLICANT: Bannet, David J
; APPLICANT: Smith, Richard S
; TITLE OF INVENTION: AND SYSTEMS FOR QUANTIFYING APO AI, AND THERAPEUTIC
; TITLE OF INVENTION: METHODS
; TITLE OF INVENTION: METHODS
; NUMBER OF SEQUENCES: 4
; CORRESPONDENCE ADDRESS:

Hepatitis C virus.
Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FRAIN-ATCC 49256;

Karpatral V., Ivanova N., Anderson I., Reznik G., Bhattacharyya A., Gardner W.L., Mikhailova N., Larsen N., D'Souza M., Walunas T., Haselkorn R., Overbeek R., Kyrpides N.; Submitted (JAN-2003) to the EMBL/GenBank/DDBJ databases.
-!- CAUTION: The sequence shown here is derived from an EMBL/GenBank/DDBJ whole genome shotgun (WGS) entry which is
LDL receptor binding (Potential).
Heparin-binding (By similarity).
8 X 22 AA approximate tandem repeats.
                                                                                                                                                                                                                                     58 SKLREQLGPVTQEFWDNLEXETEGLRQEMSKDLEEVKAKVQPYLDDFQ 105
